

Task 2: JavaScript Mini Project – Web Calculator

Submitted By: Ganeshji Sahu

Project Overview

As part of the JavaScript Mini Project task, I developed a Web Calculator using HTML, CSS, and JavaScript. The calculator performs basic arithmetic operations and demonstrates DOM manipulation and event handling concepts.

Objectives

- Build an interactive web application using JavaScript.
- Understand DOM manipulation.
- Handle user interactions through button clicks.
- Create a simple and responsive user interface.

Technologies Used

- HTML5
- CSS3
- JavaScript

Features

- Addition
- Subtraction
- Multiplication
- Division
- Clear and Delete Functions
- Responsive Design
- DOM Manipulation

Project Working

The calculator accepts input through on-screen buttons. When a user clicks a button, JavaScript updates the display dynamically. Mathematical expressions are evaluated and the result is displayed instantly.

2. Performing a Calculation

3. Mobile Responsive View

Sample Code Snippets

HTML:

```
<input type='text' id='display' readonly>
```

JavaScript:

```
function calculate() {  
    display.value = eval(display.value);  
}
```

Learning Outcomes

- Improved JavaScript skills
- Learned DOM manipulation
- Practiced event handling
- Gained experience with GitHub and project deployment

Conclusion

This project helped me understand JavaScript, DOM manipulation, and front-end development concepts. It successfully meets the requirements of the JavaScript Mini Project task.
